

Sprint Review

Sprint Goal: The defined goal of the sprint, summarizing the main objectives in terms of product/release functionalities.

R.: In this sprint it was planned to improve some parts of the GUI namely the login part, create account, change password if it was forgotten and the welcome page when logging in successfully. Related to the database, it was intended to implement the part where the users must create their own events and manipulate them as they want. Besides this, it was also defined as an objective to improve the login, create an account and delete an account, since they had already been tested previously but needed some improvements.

Sprint Planning: a list of estimated User Stories that are planned to be completed by the end of the Sprint.

R.: Since several crucial user stories for our product were already implemented in the previous sprint, such as creating an account, login, among others, in this sprint the important user stories to implement were:

6	Member	create events	he can organize his schedule	Must	#3	Completed
4	Member	change my password	his account is protected	Must	#3	Completed
10	Member	see the events in the format of days	the user can see what he is doing in that day	Must	#3	Completed
12	Member	change parameters of events	the user can manage his events	Must	#3	Completed
13	Member	delete events	the user can manage his events	Must	#3	Completed

Note: these features are being tested on the terminal, next sprint it's planned to connect it to the GUI.

Done User Stories: a list of the actual User Stories that were completed during that Sprint.

R.: Fortunately, it was possible to achieve all the goals idealized for this sprint:

6	Member	create events	he can organize his schedule	Must	#3	Completed
4	Member	change my password	his account is protected	Must	#3	Completed
10	Member	see the events in the	the user can see what he is	Must	#3	Completed

		format of days	doing in that day			d
12	Member	change parameters of events	the user can manage his events	Must	#3	Completed
13	Member	delete events	the user can manage his events	Must	#3	Completed

Sprint Retrospective: "Did well", "Do differently", "Puzzles".

R.: The work was split between developing the database and the GUI. Both tasks took place positively, making it possible to achieve the intended goals for this sprint. However, we came to the conclusion that the projects should have been merged from the beginning, because now, it will probably be more complex to combine the 2 programs. We will work on this during the next sprint.

Sprint Review: A team and product owner' perspective of the product increment of the current sprint.

R.: This sprint was very important because it was during these weeks that we really started the development of the calendar app. It was during this sprint that we finished the first part of the project up until when the user can log into the account (the welcome page). Thus, now the user is able to create a new account, login into their account, delete their account, create an account, change their password, etc, although, for now, all of this is tested only in the terminal. This is vital for the user interface, the structure and framework of the app.
