

Sprint Review 3

Sprint Goal: The defined goal of the sprint, summarizing the main objectives in terms of product/release functionalities.

R.: In this sprint it was planned to better the user interface and most importantly to merge the GUI project with the database project. Concerning the GUI, the delete account feature, the change password feature and the daily view scene were implemented successfully. We managed to improve the login, create and delete an account, as it was established in the last Sprint Review. Besides this, it was also defined as an objective to be able to define events in the GUI in the daily view and monthly view for the next Sprint.

Sprint Planning: a list of estimated User Stories that are planned to be completed by the end of the Sprint.

R.: We were planning on not only merge the two projects together by being able to do what we had done in the last sprints on the user interface, but also to add more features to our application, namely a way of the user seeing their personal informations and to already create the possibility of seeing the events in a daily view in the app:

2	Member	create an account	he can use the app	Must	#2	Completed
3	Member	login	he can enter the app	Must	#2	Completed
4	Member	change my password	his account is protected	Must	#3	Completed
10	Member	delete my account	i can start a new account	Could	#2	Completed
5	Member	see my personal informations	the user experience is personalized	Should	#4	In Progress
9	Member	see the events in the format of days	the user can see what he is doing in that day	Must	#4	In Progress

Done User Stories: a list of the actual User Stories that were completed during that Sprint.

R.: Unfortunately, it was not possible for us to achieve all the goals idealized for this sprint, namely because we were focused on merging the two projects together, which took more time than expected. We already were able to implement all of these in past sprints in the terminal as it was said in the last sprint, but it is now possible to do all of these tasks in the GUI, which was our main goal for this sprint:

2	Member	create an account	he can use the app	Must	#2	Completed
3	Member	login	he can enter the app	Must	#2	Completed
4	Member	change my password	his account is protected	Must	#3	Completed
10	Member	delete my account	i can start a new account	Could	#2	Completed

Sprint Retrospective: "Did well", "Do differently", "Puzzles".

R.: Did well: A thing we were able to do well was to communicate between ourselves in order to merge the project by having meetings about how we were going to do this and how our code fitted with the other. Also we had meetings about how we are going to implement the next part of our project: the way of seeing events from a calendar perspective.

Do differently: Next time we do a project with dimensions that this one is taking, we should not start a project with two separate codes and directories, as the merging between the two took needless amounts of effort.

Puzzles: We have yet to find a way of making the GUI in such a way that we are able to dynamically alter the events duration in an aesthetically pleasing manner.

Sprint Review: A team and product owner' perspective of the product increment of the current sprint.

R.: It was in this sprint that our application actually came to life, as far as the GUI is concerned, which is as important as the database. We are now able to interact with an actual app as any other application you would find nowadays. This was our most important sprint for us yet, as we also were able to gain new knowledge about theoretical technicalities and not only about how to do an application. It is of great importance to start any project together. Although we were not able to conclude all that was programmed for this sprint, we still believe that the work we did this week was very important to avoid furthering the stray in the trajectories of our projects. It was a small obstacle that, in the end, moved our work forward in an incredible way.
